

Supplementary Figure 3. Nitazoxanide and Tizoxanide inhibit ZIKV replication under different MOIs

Vero cells inoculated with ZIKV were treated with indicated doses of Nitazoxanide or Tizoxanide using MOI=0.1 (A, C) or MOI=1 (B, D). The cells were harvested for ZIKV RNA detection with qRT-PCR. Data shown here represent at least three independent experiments performed with internal duplicates.
